Pushing/Dragging Users Towards Better Utilisation.

Guy Robinson.

Arctic Region Supercomputing Centre, Fairbanks, ALASKA, USA.

Overview

Short Introduction to ARSC.

* Mission, Resources, Projects.

♦ Improve Users.

* Code development, tools,

* Training,

✤ Support and Assistance.

♦ Improve System.

* Make it easier for users to be productive.

Changing system and users.

Mission

To support computational research in science and engineering — with emphasis on high latitudes and the Arctic

http://www.arsc.edu/

To Facilitate that Mission...

ARSC provides:

* Hardware

+ Large Memory Vector and MPP Computing Resources

Visualization Resources

* Software

+ Various Packages for Various Platforms

* People

+ Specialists in HPC for Technical Support

+ User Training

Monitoring Users. ♦ NQS usage. * actual jobs in terms of number of processors and runtimes. ♦ grmview. * memory usage. + 'try to fill processors memory', but still allow small memories/ large processor numbers. Ensuring our big users get results. Solution with the second se

High Resolution Weather Forecasting

1										-						

- VAMPIR allows users to inspect message passing.
 - * Considerable detail and information available.
 - Easy to identify areas for improvement in algorithm. Great help when fine tuning across different architectures/problem sizes etc.
 - * Also VERY useful for training and explaining to others how code works.

Improvements in the longer term.

Changes to code.

* don't fix the number of processors! Setter, real parallel algorithms. \Rightarrow algorithms for the size of problem the user wishes to solve. ◆ Leading by example. If forward success stories to the userbase. + sudden increases in problem size/complexity brings new needs.

DoD Grand Challenge Project

Unsteady Hydrodynamics of the Maneuvering Submarine

This grand challenge project has been granted 170,000 processor hours (approximately 25% of the available cycles) on the CRAY T3E for the current year.

Embarrassingly Parallel! Not a failure. Lots of productive science done this way. Does take effort. Management of files and putting answers together to review all results is key. + visualisation efforts, weather/climate and groundwater parameterisation studies. **System advantage is it can fill the system CPU resources.** + Users must be flexible in job sizes. + Taken our MPP utilization to 95%/75%/85% for first quarter of 98.

• Currently often running 4 jobs which fill system.

SAR Imagery to Measure Arctic Soil Moisture

 Doug Kane, Larry Hinzman, University of Alaska Fairbanks

System Improvements at ARSC.

Queues.

- A migration exit in NQS. Rearranges work to combine any holes in processor space and permit large jobs to run.
- Checkpointing allows big jobs at night and interactive/Quick jobs to run during the day.
- Could newer software schedulers improve matters?!

Many improvements only work if users also change.

 In particular users with flexible processor demands get a better turnaround.

People.

Specialists in:

- Parallel Vector Computing
 Massively Parallel Computing
 Visualization Systems
 HPC Consulting
- Joint Faculty Appointments with University of ALASKA
 Visiting Researchers
 Administration
- Network Systems
 Mass Storage
 Computer Security
 Cray Hardware/Software

Healy Clean Coal Project

Bill Brody,
 University of
 Alaska Fairbanks

Visualization created with AliasWavefront software. This animation shows the process of scrubbing the emission gases.

Close up of bag-house and air sprayer dryer process within the HCCP power plant.

Getting messages to users. Most of ARSC cycles are consumed by remote users. * newsletter, web pages, hardcopy publications etc. + success stories by peers are more successful than pushing computing science. + addressing a users needs is better than just telling. + newsletter is sent by email and available for reference on the web. http://www.arsc.edu/pubs/MPPnews.shtml + a few basic manuals with local information and local examples of best/preferred user practices are most productive use of centre effort, e.g. NQS, CRL etc.

User Support: www.arsc.edu On-Line: August 19, 1994 (8th UA Site) * Policies & technical documentation. ☆ Cray online manuals. Application, re-registration, software request, and other forms. + FPT (form pre-processing tool) ***** Publications. + transitions bulletin, getting users into habit of regular change and 'hopefully' self evaluation. f77 to f90, D to E, Y to J to SV1?

Future plans.

Advanced schedulers.

Only if there is a clear reward!
Can 95% be improved on for an MPP?!
Continued user education.
Real parallel codes.
Improved algorithms for problem sizes/type.
Validation, tools for inspection, portability improvements.
Closer links between computation, visualisation, storage.

Al Hermann,
 Pacific Marine
 Environmental
 Laboratory

Conclusion.

Users can,

- Do nothing or do everything?
 - Work with a small number of tools in a simple manner.
 - Tell other users and the centre of both good and bad experiences.
 - + Be flexible.

Centres can,

- Do everything or do nothing?
 - Make a number of simple changes which greatly reinforce good user behaviour.
 - Lead users forwards by promotion/example.
 - + Be flexible.
