# Application Performance Profiling on the Cray XD1 using HPCToolkit

John Mellor-Crummey<sup>1</sup>, Nathan Tallent<sup>1</sup> Michael Fagan<sup>1</sup>, and Jan E. Odegard<sup>2</sup>

<sup>1</sup>Computer Science <sup>2</sup>Computer & Information Technology Institute Rice University

# Computer and Information Technology

To build a community of scholars that engages in collaborative research and education covering virtually every aspect of information technology and computing

Directors:

Ken Kennedy (1986-1992)

Sidney Burrus (1992-1998)

Willy Zwaenepoel (1998-2001)

Moshe Vardi (2001-...)

6 schools  $\leftarrow \rightarrow$  20 departments  $\leftarrow \rightarrow$  140 members 7 centers  $\leftarrow \rightarrow$  12+ ad hoc research groups

### **Research Centers**

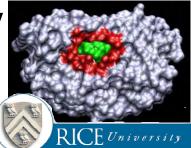

- Center for High Performance Software (HiPerSoft)
   —Director: TBN
- Center for Multimedia Communication (CMC) —Director: Behnaam Aazhang, ECE
- Center for Computational Geophysics (CCG) —Co-directors: Bill Symes, CAAM / Alan Levander, ES
- Center for Computational Finance & Economic Systems (CoFES) —Director: Kathy Ensor, STAT
- LAboratory for NanoPhotonics (LANP)
   —Director: Naomi Halas, ECE
- Center for Technology in Teaching and Learning (CTTL) — Director: Tony Gorry, CS
- Center for Excellence and Equity in Education (CEEE) — Director: Richard Tapia, CAAM

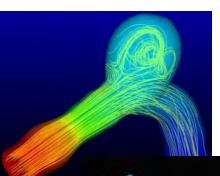

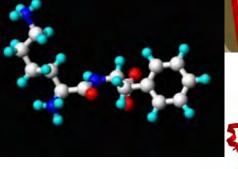

# **Research Groups & Labs**

- Gaming Group
- Robotics Group
- Sensor Nets Group
- Bioinformatics Group
- Rice Networking Group
- Digital Signal Processing
- Dynamical Systems Group
- Statistical Consulting Lab
- Rice Computer Architecture Group
- Complex Flow of Complex Fluids Group
- Theoretical and Computational Neuroscience
- Connexions: Open content education repository
- Advanced Research Initiative on the Emerging Library
- •

RobotStudio -S4 Lite

#### Cray XD1 System Dual-Core AMD Opteron<sup>TM</sup>

#### **"Rice Computational Research Cluster"**

- ~3 TeraFLOP Cray XD1 Linux cluster\*
  - -336 Dual-Core AMD Opteron<sup>™</sup> 275
    - 2.2GHz, 1MB / Core
    - 168 dual socket nodes (4 way SMP)
    - 8 GB DDR 400 / compute SMP
    - 16 GB DDR 333 / system SMP
  - -Cray RapidArray (4x Infiniband)
  - -1.4 TB DDR2 400
  - -12 TB Local Disk
  - -6 TB Lustre parallel file system
  - -10 TB NFS file system
  - -One XD1 Chassis with FPGA
    - 6 Xilinx Virtex-4/LX160

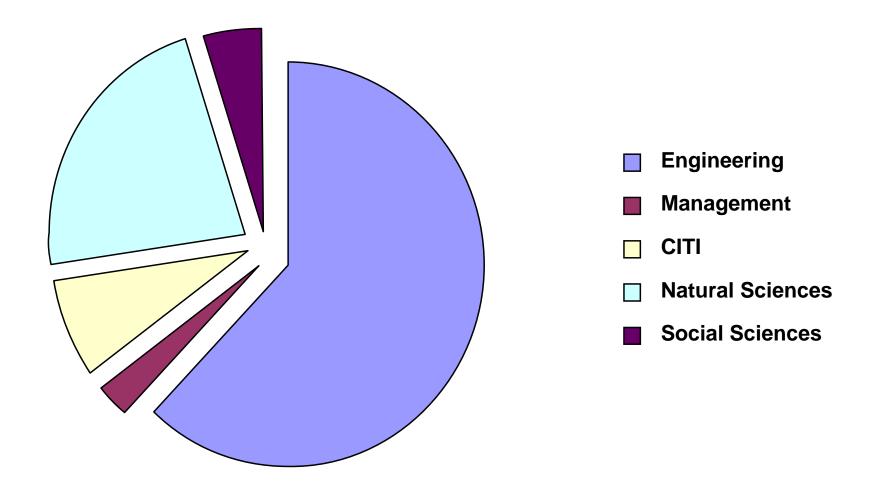

NSF MRI, Rice, AMD and Cray

#### **250+ Active Users**

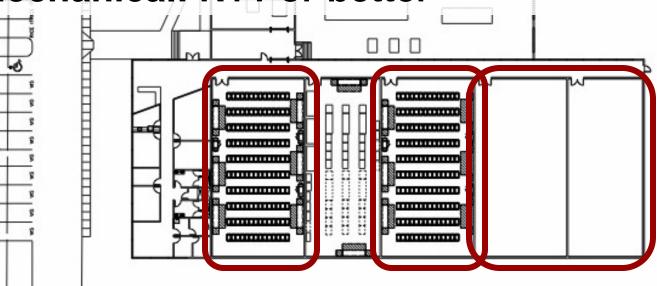

## **New Datacenter (July 2007)**

CITIZO

- 20,000 sq.ft. (48" raised floor)
- 6 MWatt inbound power
- Three pod configuration (3-15+ KW/rack)
- Three separate electrical systems (A, B & C)
- Mechanical: N+1 or better

#### Datacenter (~12-06)

#### Datacenter (~12-06)

**The Challenge** 

#### **Getting Science Done**

To achieve acceptable (top) application performance scientists and engineers are required to tailor applications to effectively exploit the capabilities of a "bewildering" array of features offered by current and future architectures

#### **Performance Analysis and Tuning**

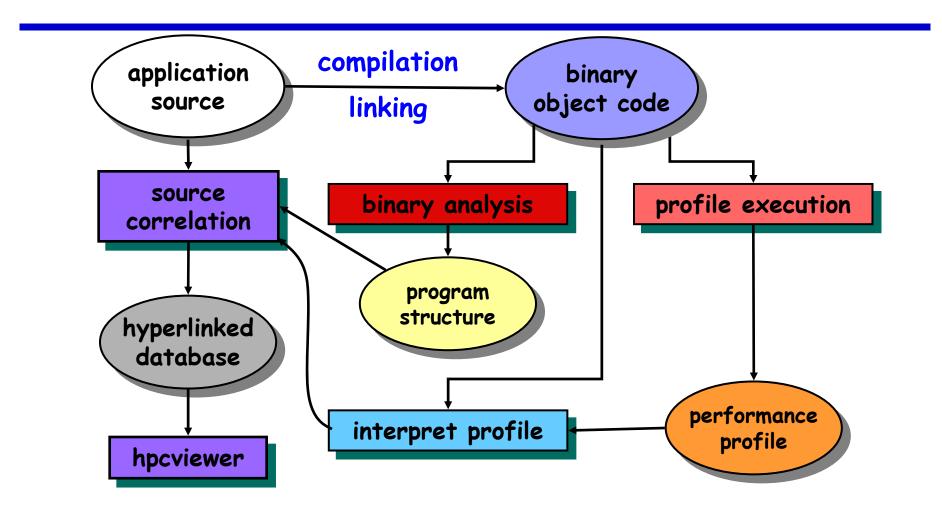

- Increasingly necessary
  - -gap between typical and peak performance is growing
- Increasingly hard
  - -complex architectures are harder to program effectively
    - complex processors
      - deeply pipelined, out of order, superscalar
    - complex memory hierarchy
      - non-blocking, multi-level caches, TLB, hw prefetching
  - -modern scientific applications pose challenges for tools
    - multi-lingual programs
    - many source files
    - complex build process
    - external libraries in binary-only form

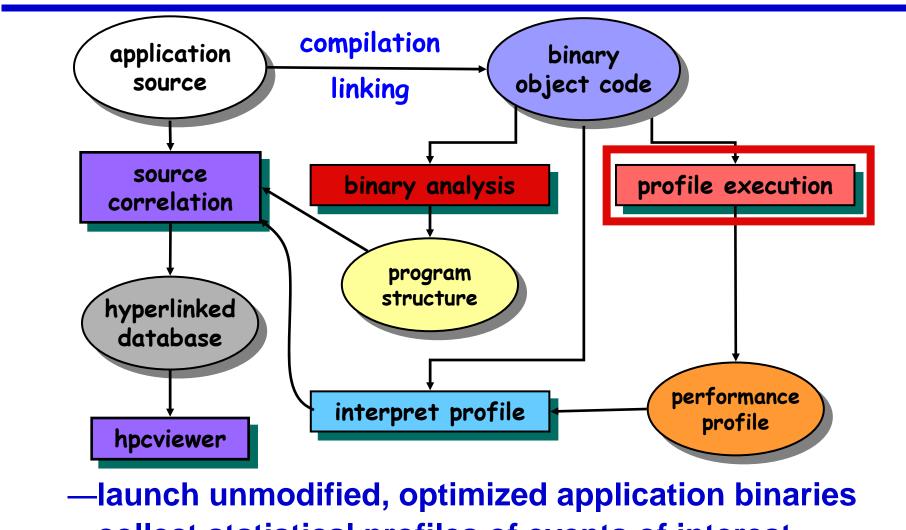

## **HPCToolkit Goals**

- Support large, multi-lingual applications
  - -a mix of of Fortran, C, C++
  - -multiple programming models (MPI, OpenMP, multi-threading)
  - -external libraries
  - -hundreds of procedures
  - -for ease of use, avoid
    - manual instrumentation
    - significantly altering the build process
    - frequent recompilation
- Analysis of both serial and parallel codes
- Scalable data collection for parallel executions
- Effective presentation of analysis results
  - -intuitive enough for scientists and engineers to use
  - -detailed enough to meet the needs of compiler writers

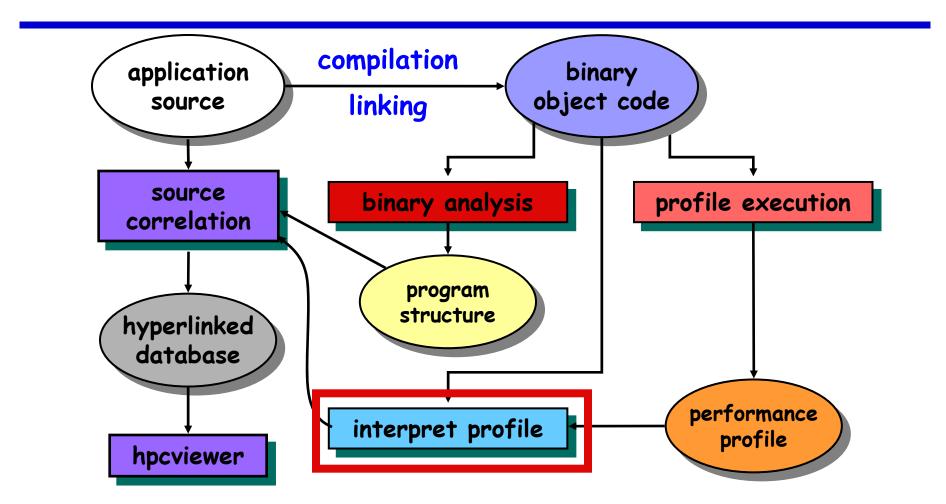

#### **HPCToolkit Design Principles**

- Language independence: work at the binary level —supports multi-lingual codes with external binary-only libraries
- Avoid code instrumentation in each procedure —instrumentation adds overhead and distorts measurements
- Context is essential for understanding modern software —modular software often depends on layered libraries (e.g. MPI)
- Any one performance measure produces a myopic view
   hard to diagnose a problem with only one species of event
- Derived metrics are essential for effective analysis
- Performance analysis should be top down
- Event aggregation for loops and procedures is important —accurate despite approximate event attribution from counters —loop-level info is more important than line-level info

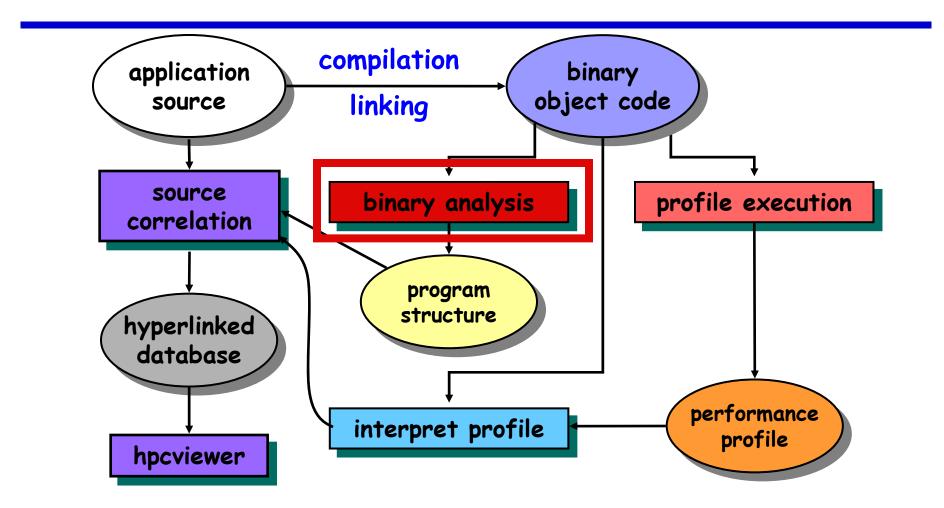

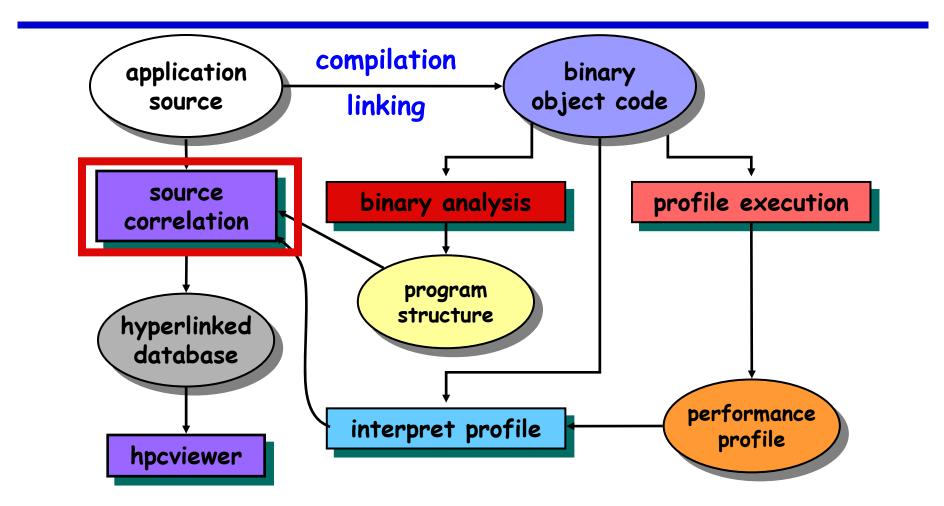

-collect statistical profiles of events of interest

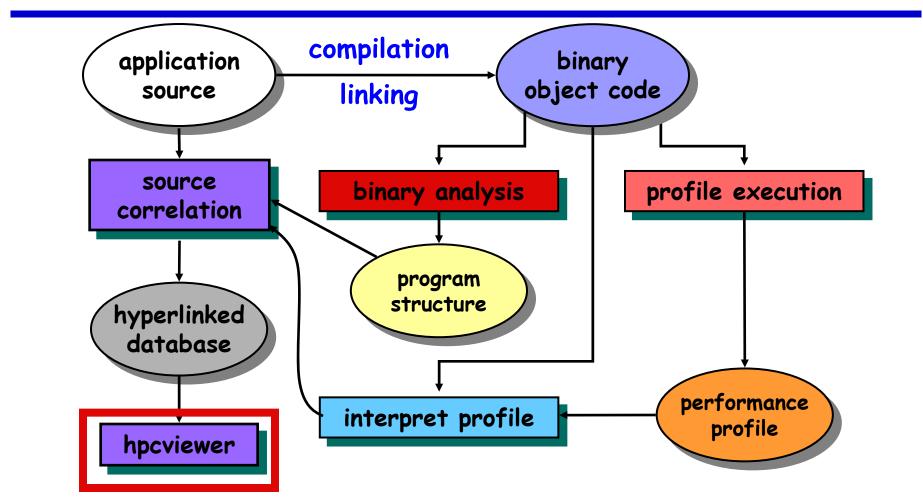

-decode instructions and combine with profile data

#### —extract loop nesting & inlining from executables

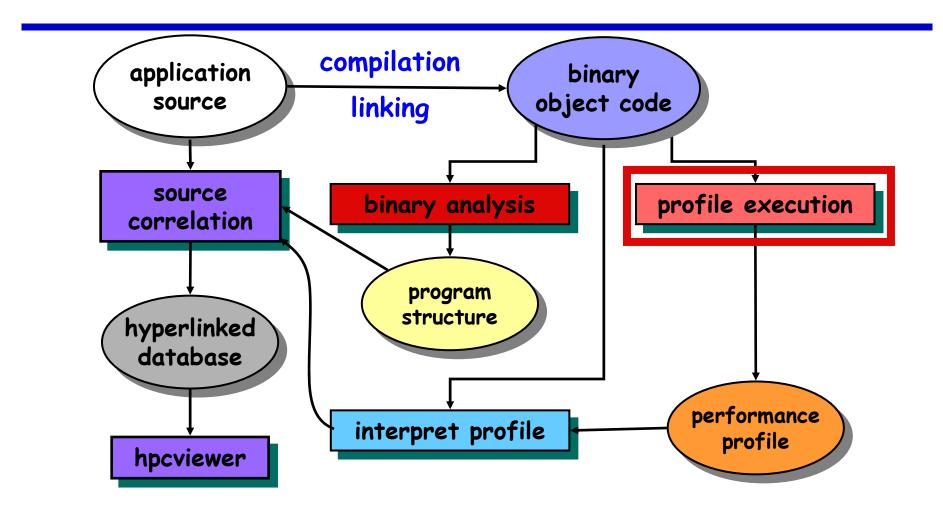

—synthesize new metrics by combining metrics —relate metrics and structure to program source

—support top-down analysis with interactive viewer —analyze results anytime, anywhere

#### **HPCToolkit System Overview**

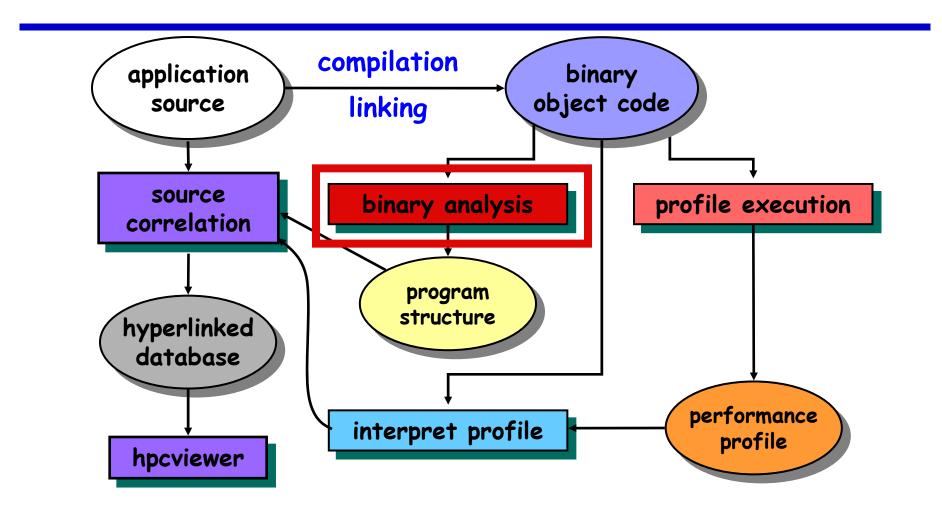

#### **Data Collection**

Support analysis of unmodified, optimized binaries

- Use statistical sampling to profile events

   hardware performance counter overflows
   interval timer events
- Tools
  - hpcrun: flat sampling yields PC histograms
  - csprof: attributes samples to calling context

#### **HPCToolkit System Overview**

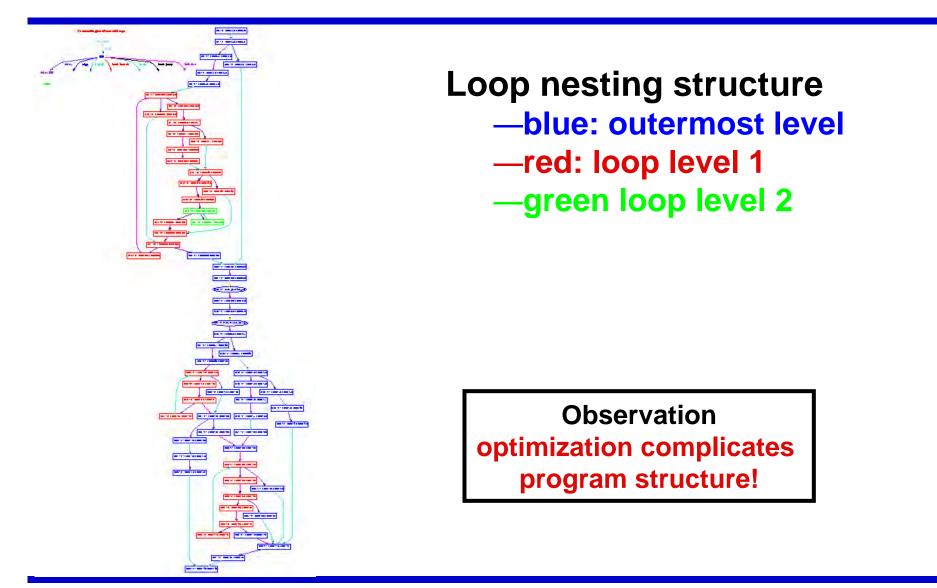

#### **Program Structure Recovery with bloop**

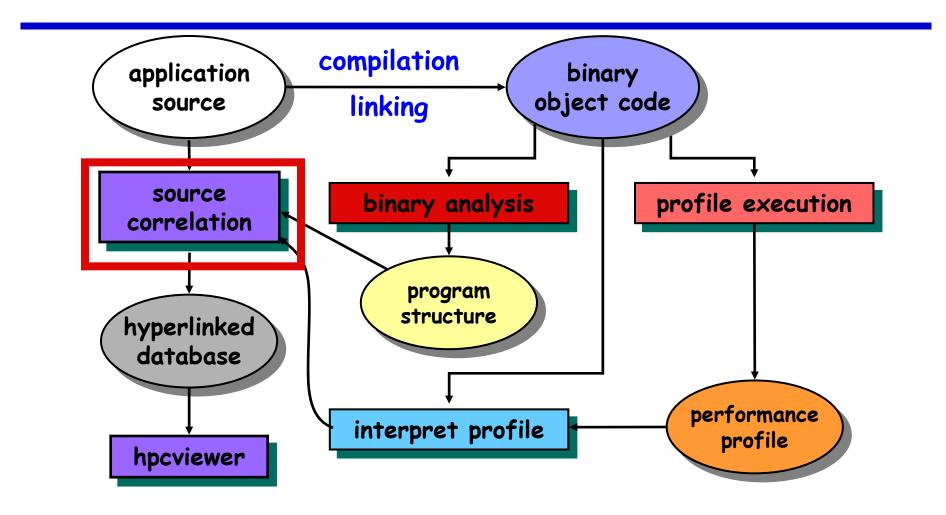

#### **Analyze an application binary**

- Construct control flow graph from branches
- Identify natural <u>loop nests</u> using interval analysis
- Map instructions to source lines, procedures —leverage line map + DWARF debugging information
- Discover <u>inlined code</u>
- Normalize output to recover source-level view

#### **Sample Flowgraph from an Executable**

#### **HPCToolkit System Overview**

#### **Data Correlation**

#### Problem

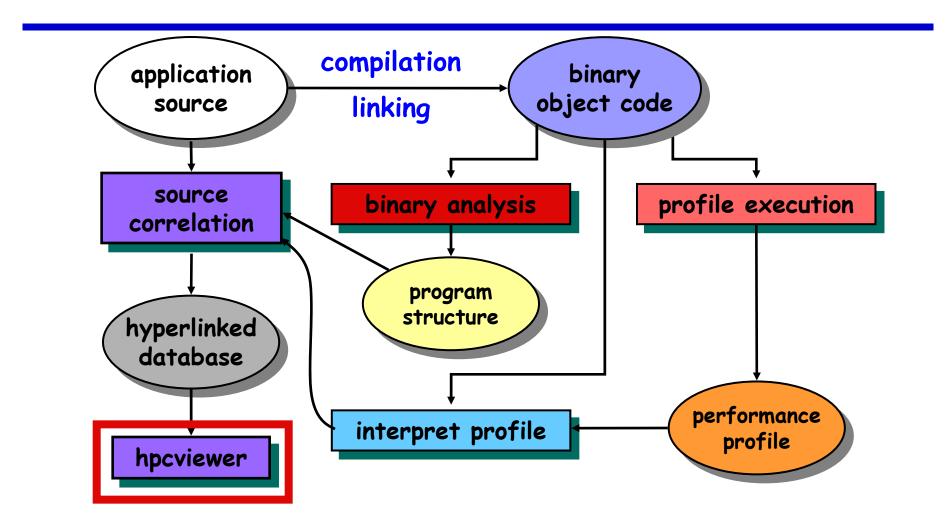

-any one performance measure provides a myopic view

- some measure potential *causes* (e.g. cache misses)
- some measure effects (e.g. cycles)
- cache misses not always a problem
- -event counter attribution is often inaccurate

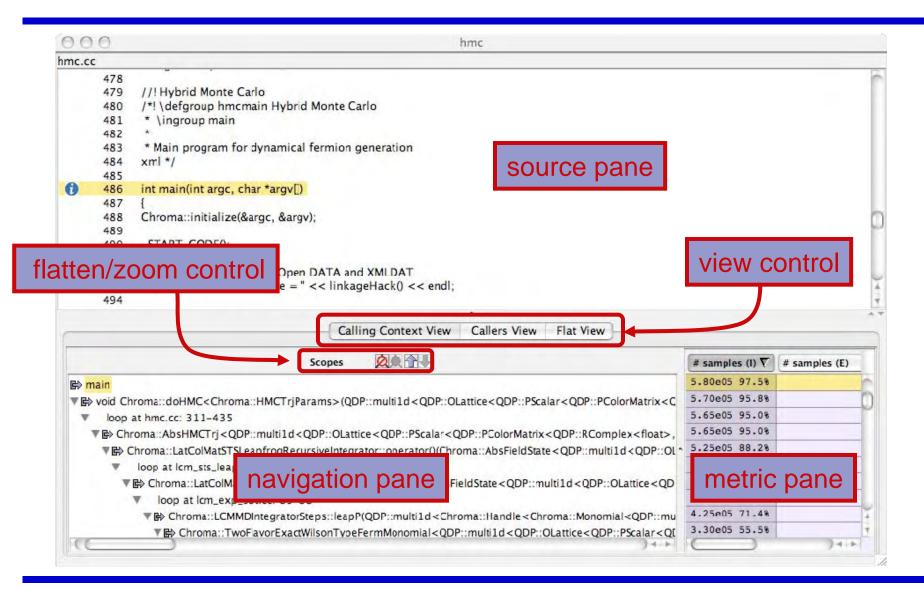

#### Approaches

- -multiple metrics for each program line
- —computed metrics (e.g. waste = peak FLOPs actual FLOPS)
  - eliminates mental arithmetic
  - serves as a key for sorting
- -hierarchical structure
  - errors with line level attribution still yield good loop-level information

#### **HPCToolkit System Overview**

#### hpcviewer User Interface

#### Principal hpcviewer Views

• Calling context tree view

*—top-down* view shows dynamic *calling contexts* in which costs were incurred

Caller's view

*—bottom-up* view apportions costs incurred in a routine to the routine's dynamic calling contexts

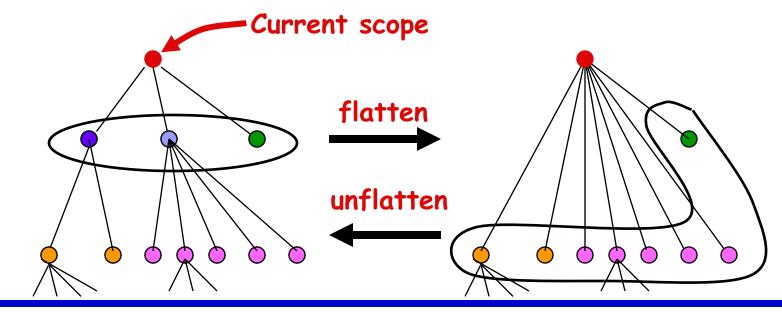

• Flat view

—aggregates all costs incurred by a routine in any context and shows the details of where they were incurred within the routine

### **Flattening Static Hierarchies**

- Problem
  - -hierarchical view of a program is too rigid
  - -sometimes want to compare children of different parents
    - e.g. compare all loops, regardless of the routine they are inside
- Solution

-flattening elides a scope and shows its children instead

## **Chroma Lattice QCD Library**

- Research prototype available only on Cray XD1 —being refined for broader use
- Porting to Catamount and CNL for Cray XT3 & XT4 —support for statically-linked binaries
- Adding support for HW counter call path profiling
- Adding support for comparative analysis
  - -viewer currently analyzes node programs
  - -enhance to analyze processes
    - within executions
    - across executions
