# Learning from What?

## Image data

*Facial recognition*  
*Action recognition*  
*Object detection and recognition*  
*Handwriting and character recognition*  
*Aerial images*  
 ...

## Anomaly data

*Time series*

## Biological data

*Human*  
*Animal*  
*Plant*  
*Microbe*  
*Drug Discovery*

## Multivariate data

*Financial*  
*Weather*  
*Census*  
*Transit*  
*Internet*  
*Games*  
*Other multivariate*

## Text data

*Reviews*  
*News articles*  
*Messages*  
*Twitter and tweets*  
*Social network*

## Signal data

*Electrical*  
*Motion-tracking*  
*Other signals*

## Sound data

*Music*  
*Speech data*

## Physical data

*High-energy physics*  
*Systems*  
*Astronomy*  
*Earth science*  
 ...

Type of data	Supported operations
discret quantitative data	Calculations, equality / difference, inferiority / superiority
Continuous quantitative data	Calculations, equality / difference, inferiority / superiority
nominal qualitative data	Equality / difference
ordinal qualitative data	Equality / difference, inferiority / superiority

Machine Learning

Big Data

NoSQL  
Analytics

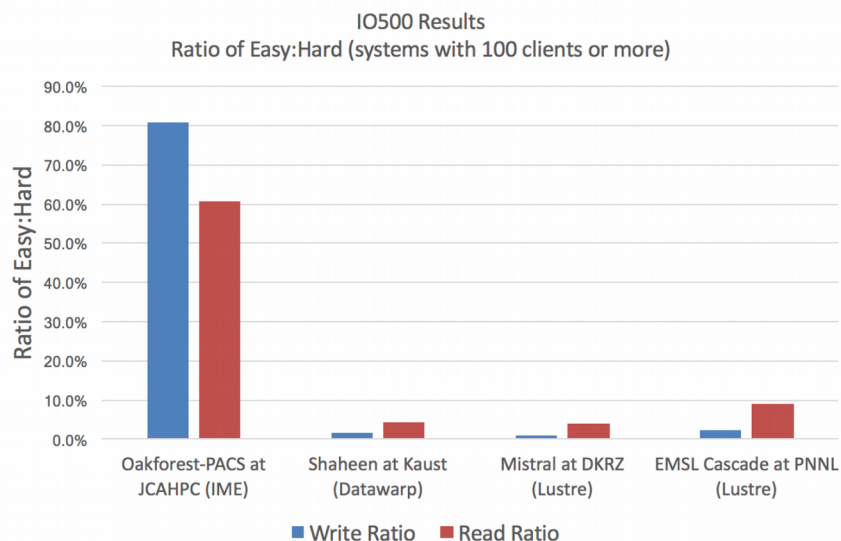

IO Characteristics: Read, Random, High Throughput per Client, File and IO Sizes between a few kb and a few MB  
**Training Sets typically larger than local caches**

# Diversity of Load: IO500

Detailed write

Rank	System	Institution	Filesystem	Client Nodes	Score	BW	MD	Easy Write	Hard Write	Hard vs. Easy	Easy Read	Hard Read	Hard vs. Easy
						GiB/s	kIOP/s	GiB/s	GiB/s		GiB/s	GiB/s	
1	Oakforest-PACS	JCAHPC	IME	2048	101.48	471.25	19.04	742.38	600.28	80.9%	427.41	258.93	60.6%
2	Shaheen	Kaust	DataWarp	300	70.9	151.53	33.17	969.45	15.55	1.6%	894.76	39.09	4.4%
3	Shaheen	Kaust	Lustre	1000	41	54.17	31.03	333.03	1.44	0.4%	220.62	81.38	36.9%

- ▶ KAUST BurstBuffer and Lustre at DKRZ show massive falls in IO performance
- ▶ Small DDN Lustre based on 12K at PNNL shows a similar pattern
- ▶ IME has a order of magnitude better ratio between easy and hard

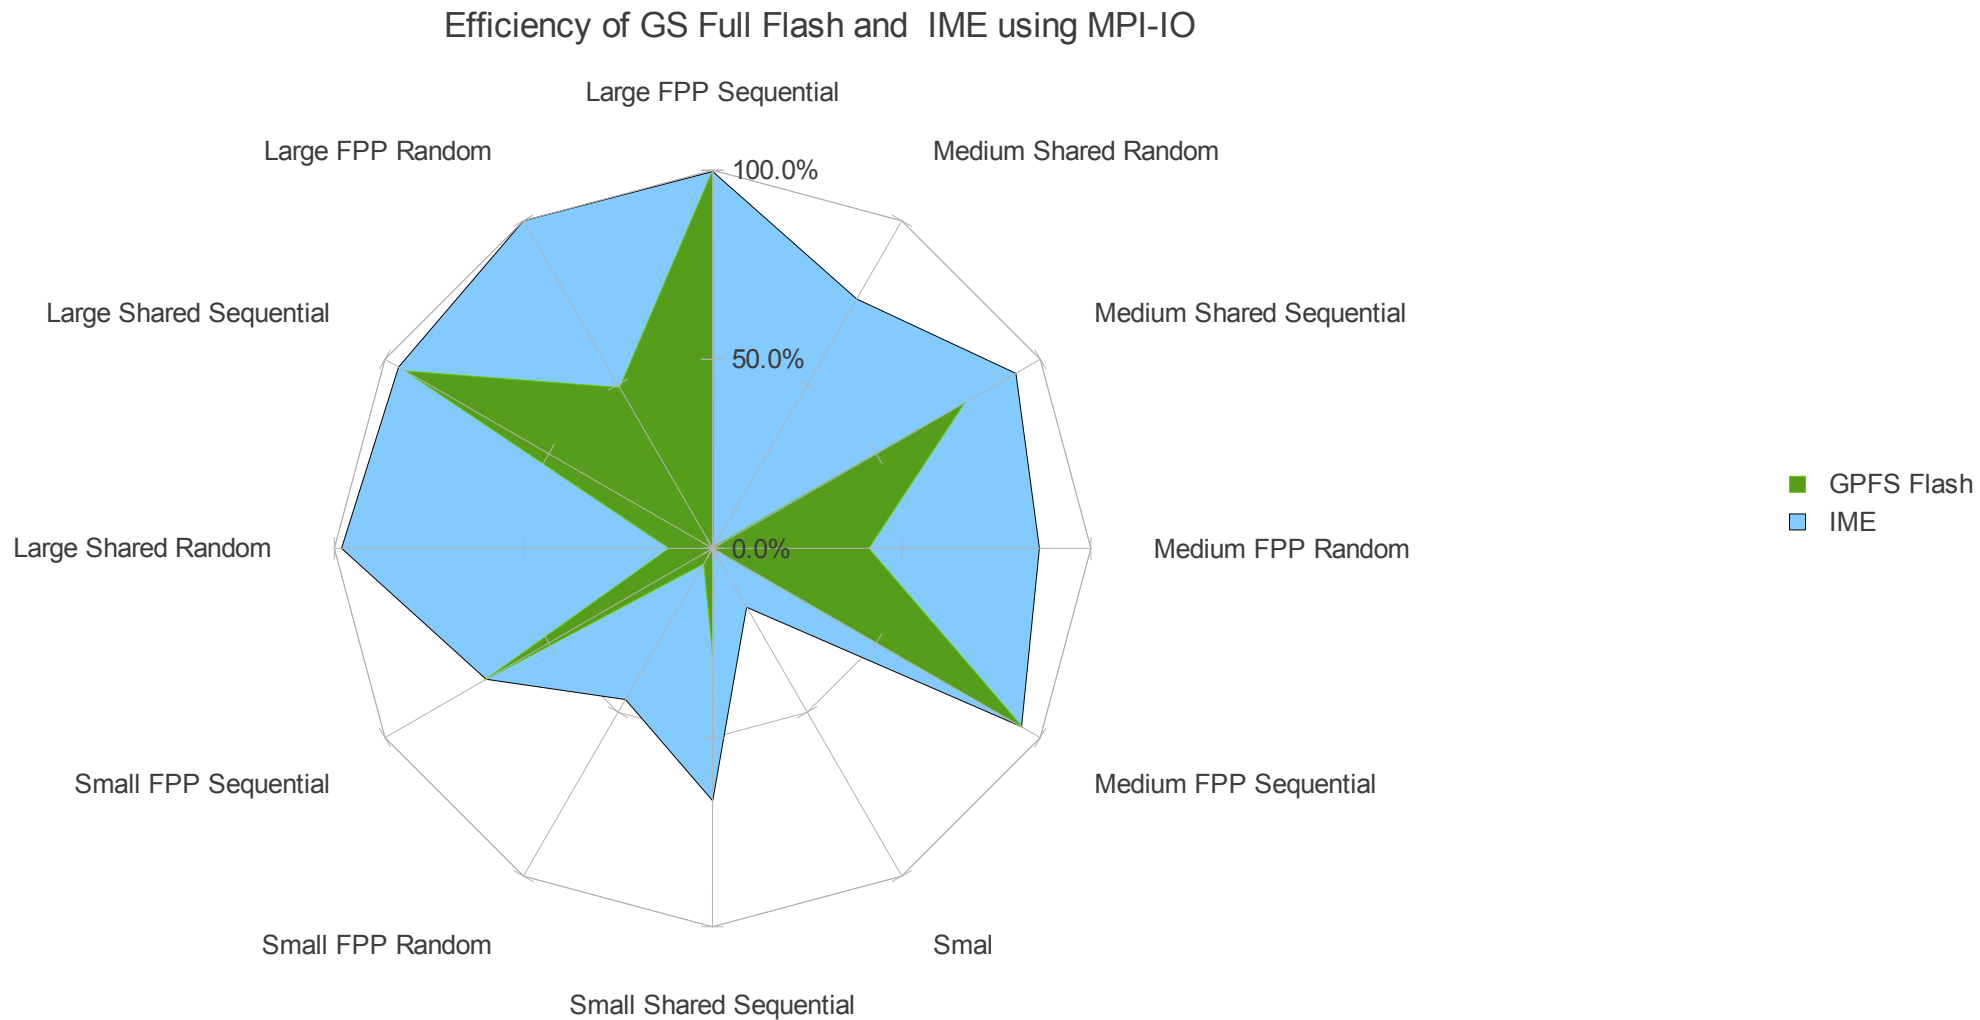

## Acknowledging multi-criteria performance metrics

I/O Granularity	I/O control plane Pattern	I/O Data plane Pattern	
Large (>= 1MB)	File Per Process ( = share nothing)	Sequential	IO500 Easy !
Large	File Per Process	Random	
Large	Single Shared File	Sequential	IO500 Hard !
Large	Single Shared File	Random	
Small	File Per Process	Sequential	
Small	File Per Process	Random	
Small (47008 Bytes)	Single Shared File	Sequential	
Small	Single Shared File	Random	

# IO500 to a comprehensive picture: DDN Flash native vs Lustre

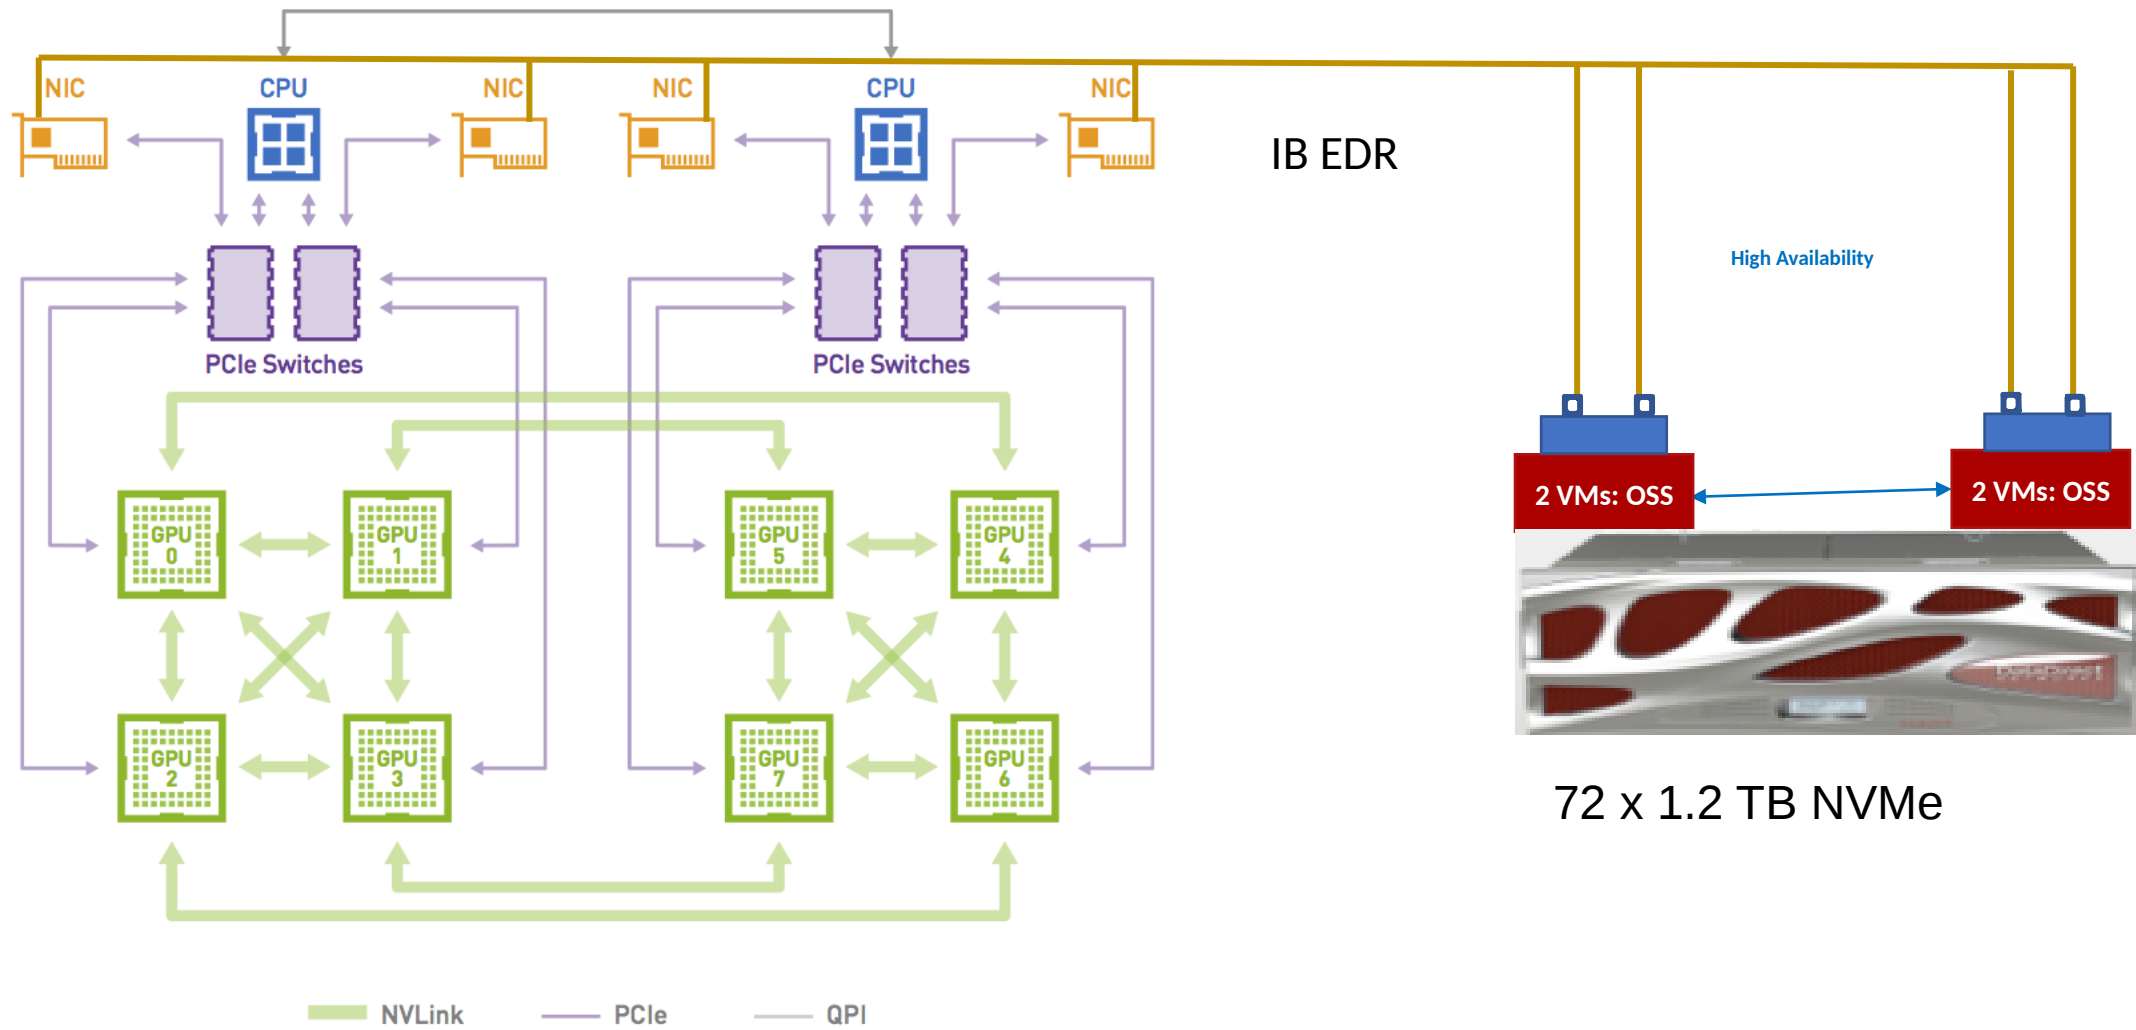

# IO500 to a comprehensive picture: DDN Flash native E vs GridScaler

Write patterns

# Example: EXAScaler DGX Solution (hardware view)

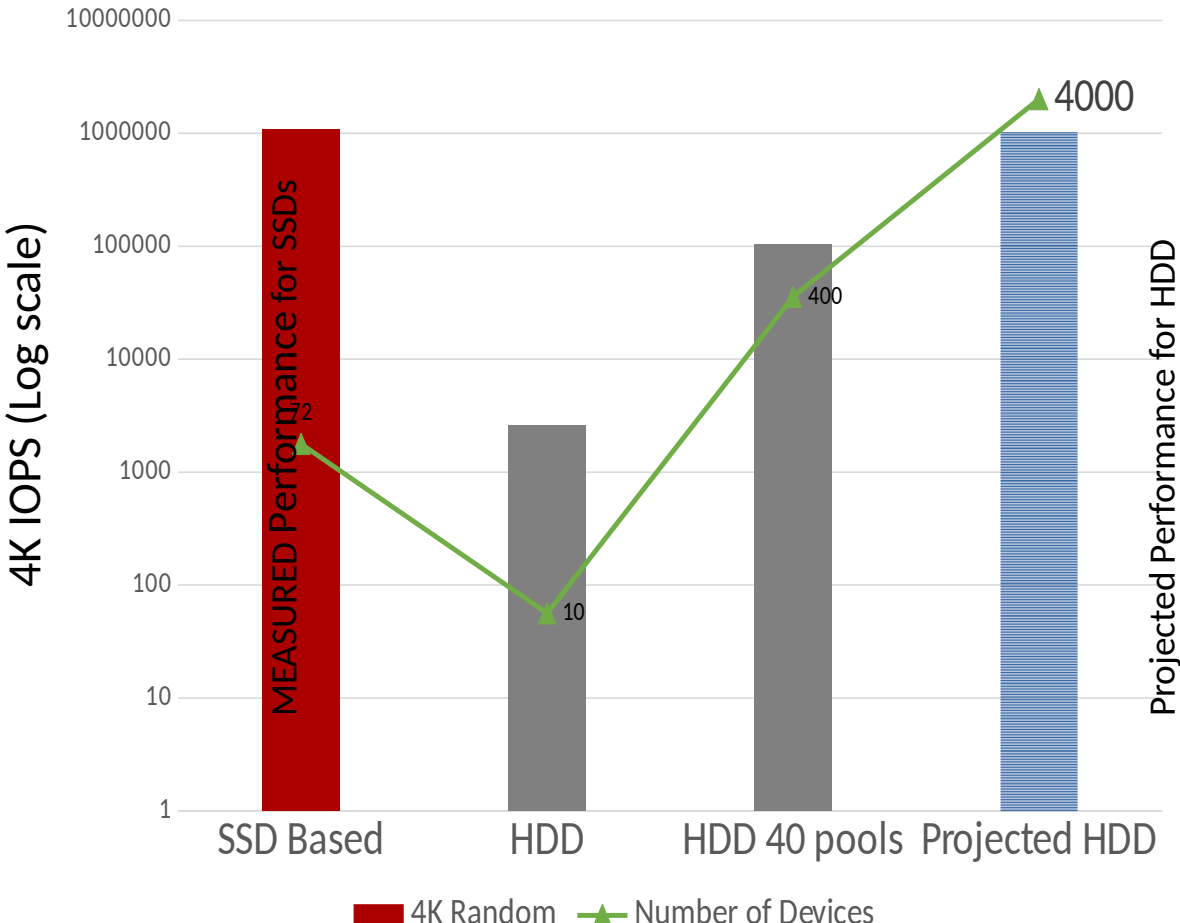

# Platform DDN ES14KXE Full Flash: 1M IOPS – 40 GB/s

- ES14KX ALL Flash active-active controllers deliver 1M file IOPs – the equivalent of 4000 HDDs
- Scale IOPs further in the namespace with additional controllers
- Augment Flash with HDD at scale with up to 1680 HDDs per controller

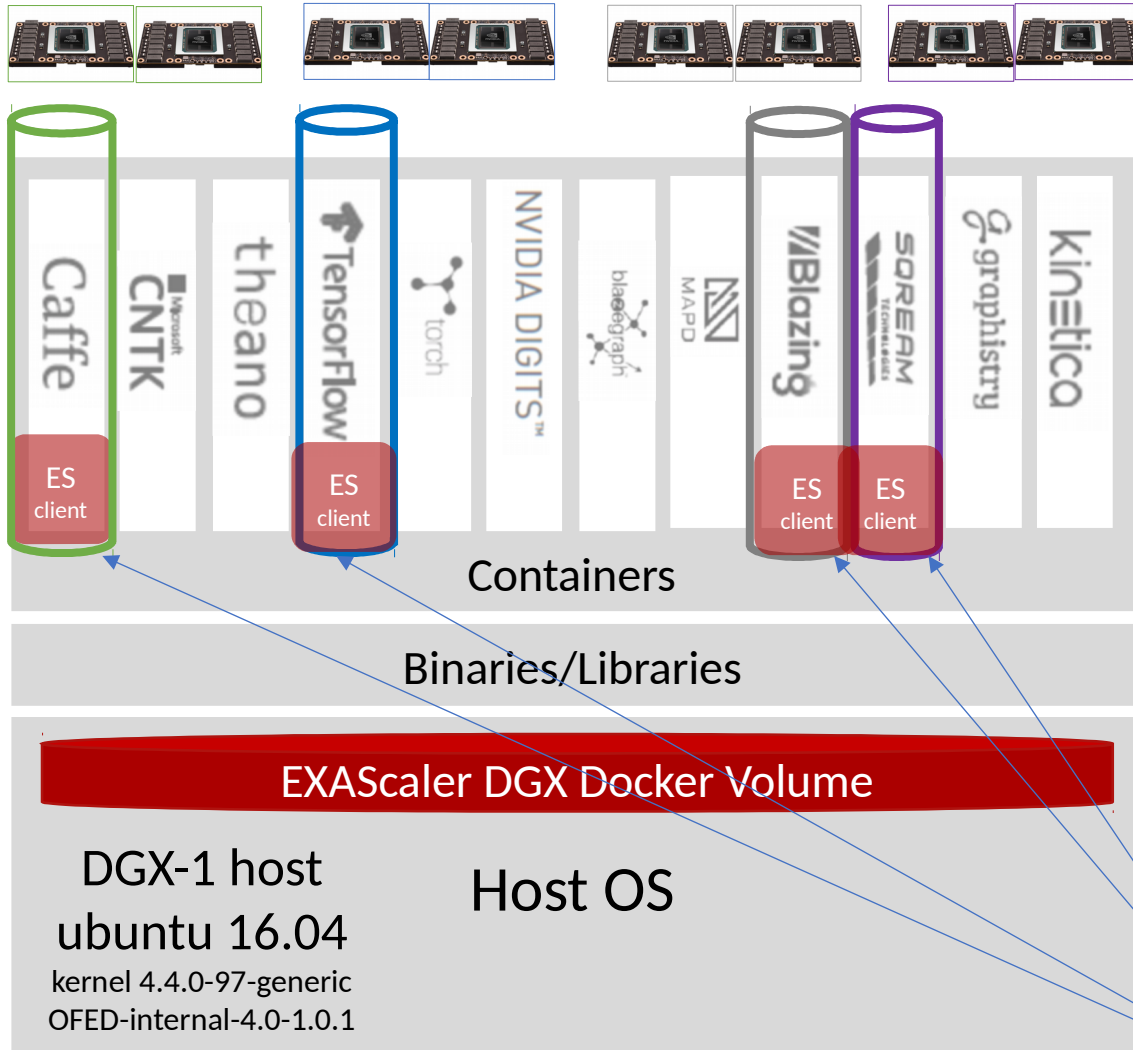

Random Read 4K IOPS on ES14KX (All Flash vs. HDD)

# WHAT PFS FOR AI APPLICATIONS?

Feature	Importance for AI	GPFS	Lustre
Shared Metadata Operations	<b>High</b> - training data are usually curated into a single directory	✗ Lower than 10K (minimal improvements with v5)	✓ Up to 200K
Support for high-performance mmap() I/O Calls	<b>High</b> - many AI applications use mmap() calls	✗ Extremely poor	✓ Strong
Container Support	<b>High</b> - most AI applications are containerized	✗ Poor (network complexity & root issues)	✓ Available
Data Isolation for Containers	<b>Medium/High</b> - important for shared environments	✗ Not available today	✓ Available
Data-on-Metadata (small file support)	<b>Medium/High</b> - depends on data set	✗ DOM only for files smaller than 3.4k	✓ DOM is highly tunable
Unique Metadata Operations	<b>Medium</b> - depends on Installation Size and Application Workflow	✓ Highly scalable	✓ Highly scalable with DNE 1/2

# Example: EXAScaler DGX Solution (host part)

Tesla P100 NVLINK (170 Tflops)

- Integrated Flash Parallel File System Access via TCP or IB
- Extreme Data Access Rates for concurrent DGX Containers

## EXAScaler DGX Docker Volume

- Lustre ES3.2 kernel modules compiled for Ubuntu kernel and host's OFED
- Lustre userspace tools
- scripts for Lustre mount/umount

Resource isolation: los/GPUs/NIC/memory/namespaces  
For the application/SW suite

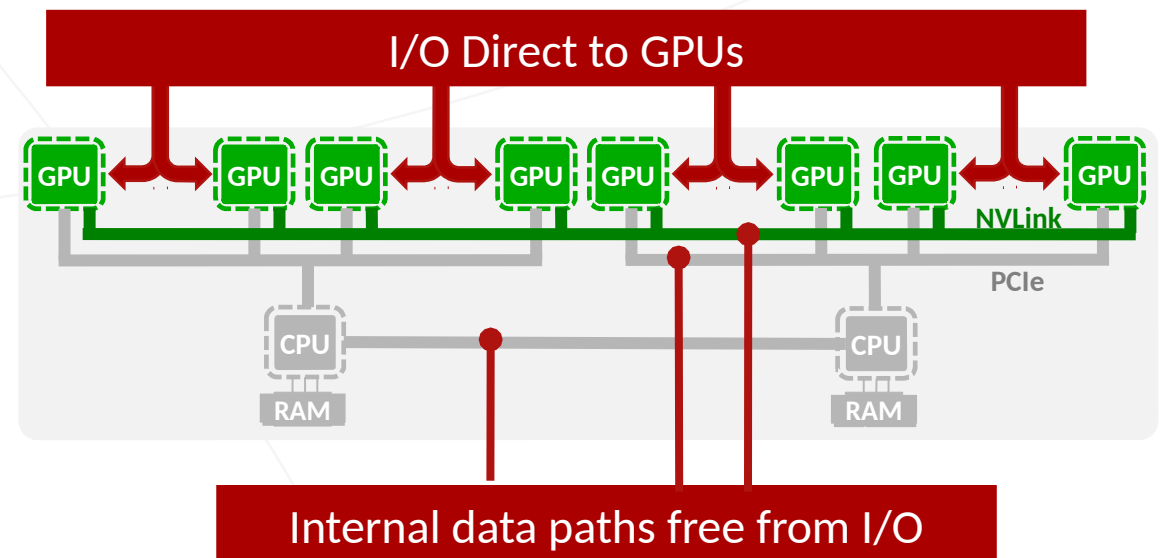

# EXASCALER + DGX-1

## CONTAINER PINNING

DDN's EXASCALER for DGX manages I/O-paths optimally through DGX-1 to maximize performance to your AI application and keep IO traffic from consuming internal data paths

## mmap() support

LMDB is key to manage file in several framework (café). LMDB relies on mmap() hence page fault to trigger kernel internal I/O call (read\_ahead)

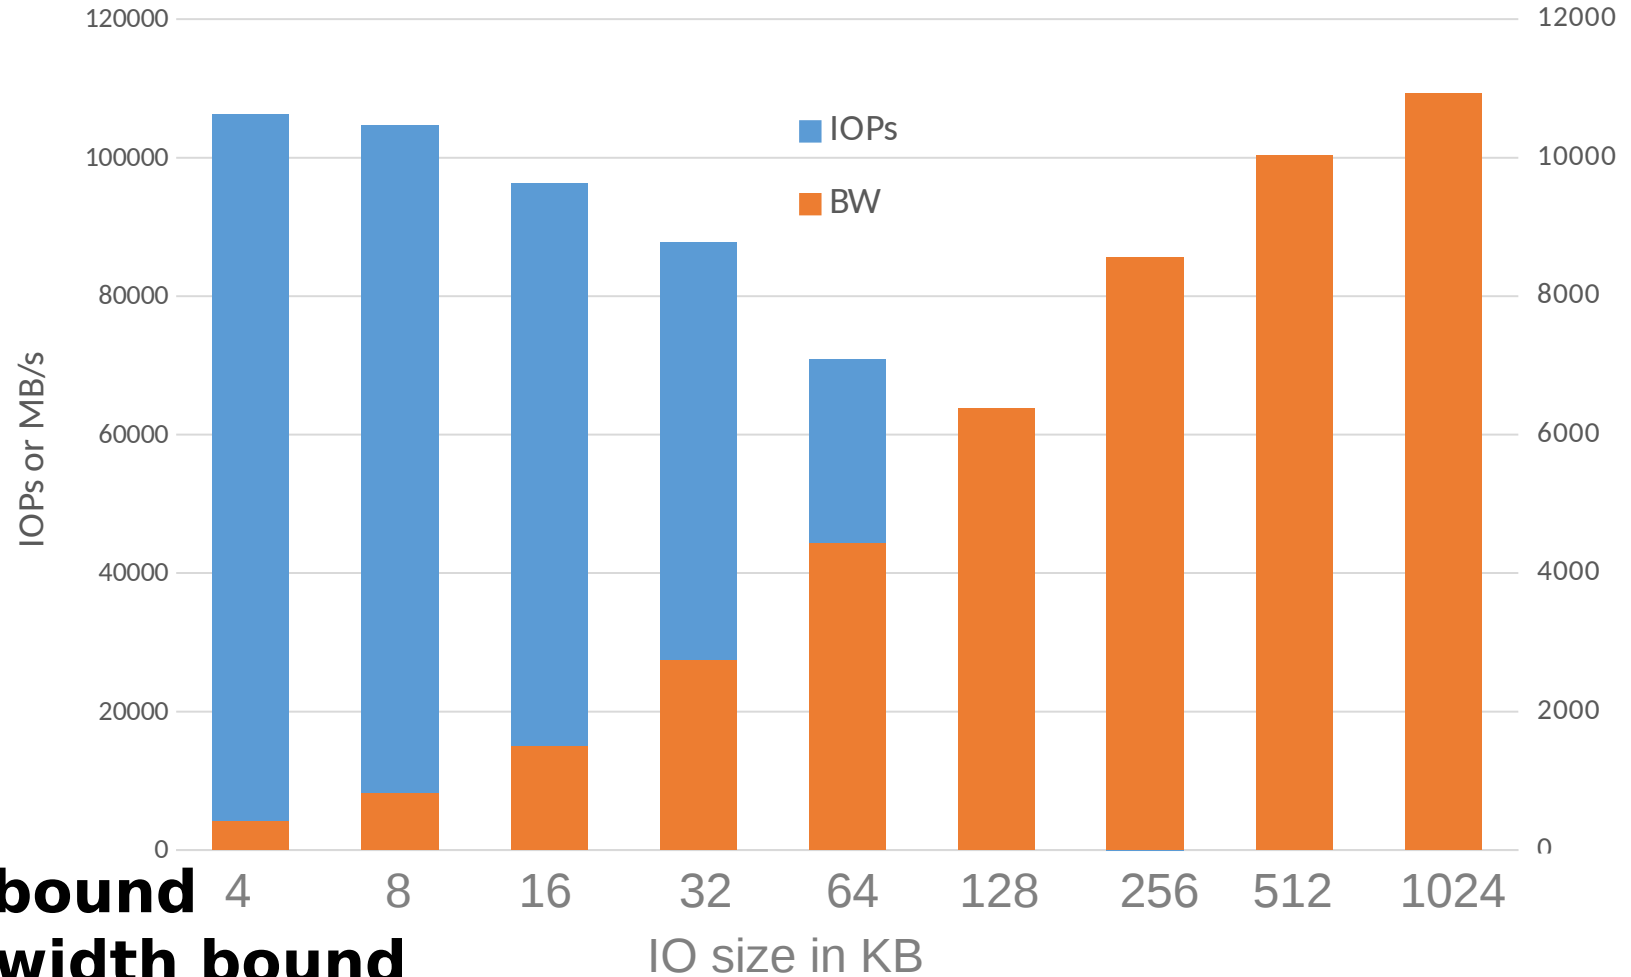

# CONTAINER PINNING OPTIMIZATION

# FROM IOPS TO BANDWIDTH

Single Container Performance (Lustre/SSD)

**4KB random read is IOPS bound**  
**1MB random read is Bandwidth bound**

# DGX CONTAINER THROUGHPUT

## SCALING UP WORKLOADS IN DGX-1

Container Throughput

Legend ▾

Overall Throughput

1 container

2 containers

3 containers

4 containers

EXASCALER ALL FLASH

# Remove I/O burden from data scientist shoulders

- I/O no longer the limiting factor
- Saturation of the network
- 250 KIOPS on a DGX-1
- 1 Millions IOPS with 4 DGX-1

## Single DGX-1

**38GB/s**  
**>250 KIOPS**

# Bringing HPC technologies and know-how to analytics = x12
